AnALyT

Drinking water - Analysis of Bacterial Contamination

Drinking Water Analysis - State-of-the-Art

Standard evaluation methods - minimum 18 hours
depending on bacterial species

- low bacterial concentrations
- high input volumes
- human factor

Contents

Project aim

Actual state

Filtration

Bacterial lysis

Luminescence biosensor

Outlook

Aim of the Project

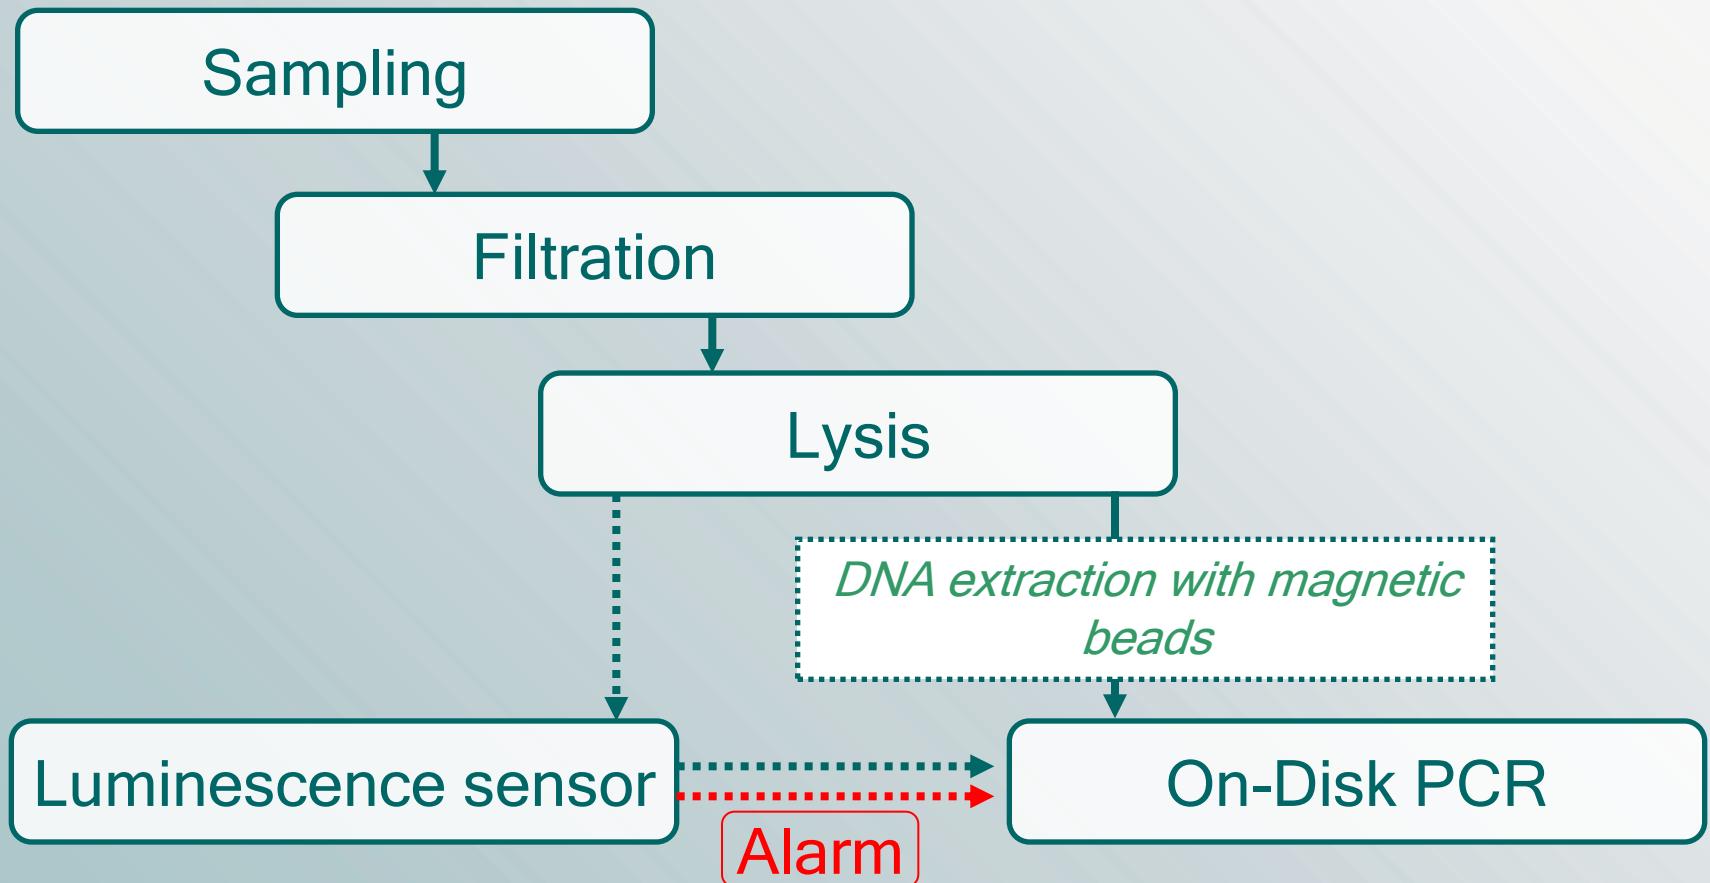

SOLUTION - online system

ENSURING fast filtration of larger water volumes
in order to increase the concentration of bacteria

DETECTING bacterial contamination via a
luciferase-based alarm system and subsequent
discrimination of 4 different bacterial species (PCR)

Water Analytical Process

FILTRATION - Concentrating Bacteria

Filtration Modules

Different filter elements

Hollow fibre

PESM membrane

ultra- and microfiltration membrane
($0.01\mu\text{m}$ or $0.2\mu\text{m}$ pore size)

How does the Filtration Work?

Two filtration steps

- water sample (manually adjustable between 1 - 100L) is forwarded to the 1st filter by a peristaltic pump
- semi dead-end filtration
- the concentrate is back-flushed by an air-water mixture
- 2nd filtration step is triggered automatically

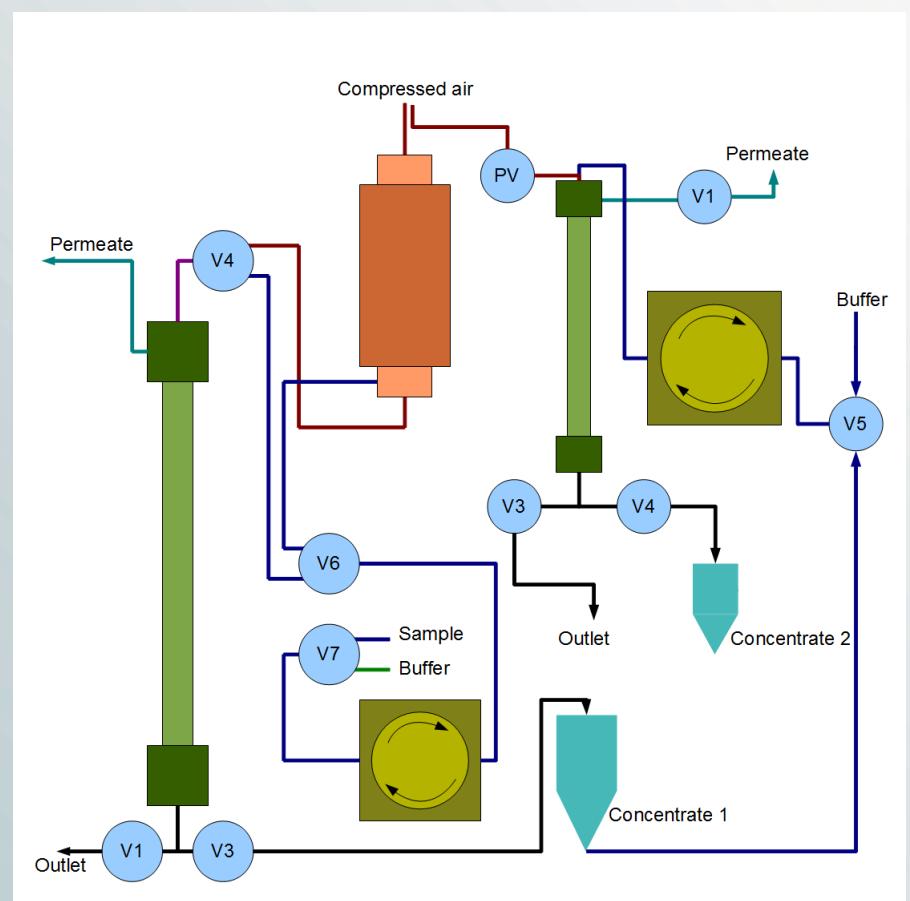

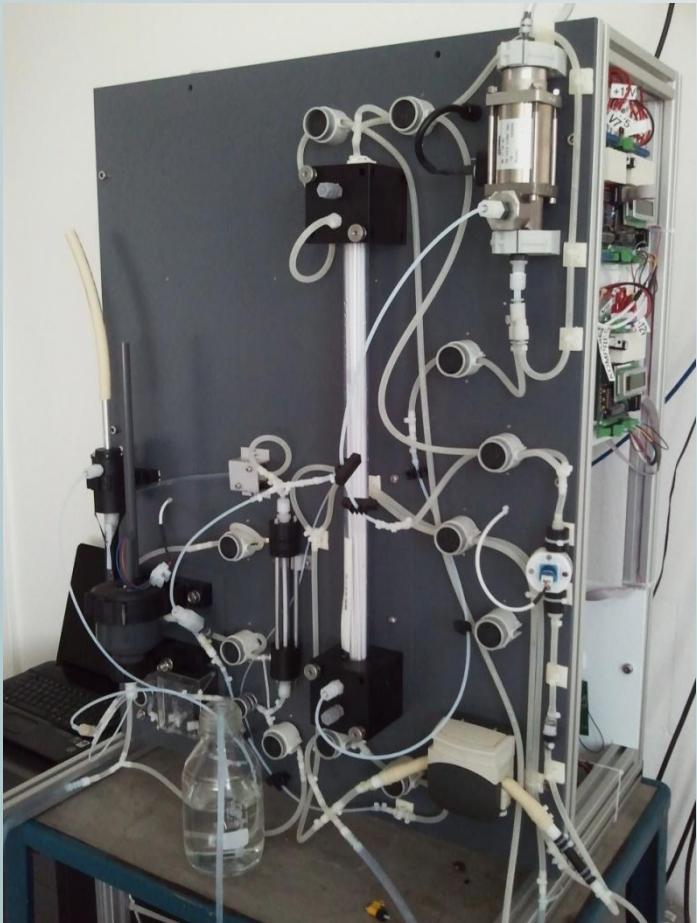

Components

- use of peristaltic pump
- fast coaxial valve switching between compressed air and water for back-flushing
- use of inner-tube valves - keeping the dead volume small
- collecting tray for both filtration steps to solve hydraulic/pneumatic problems

Filtration Module (1st and 2nd Filtration Unit)

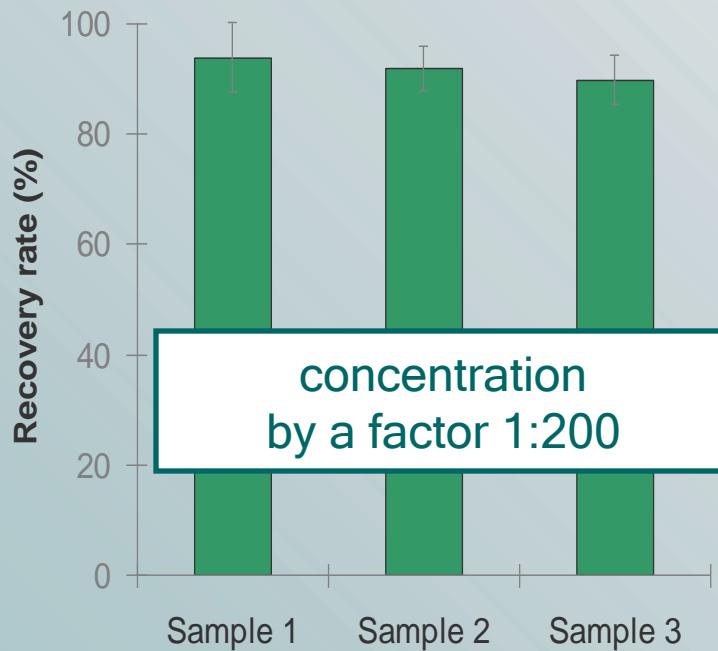

Tests of Recovery Rate

Tests with *Escherichia coli*

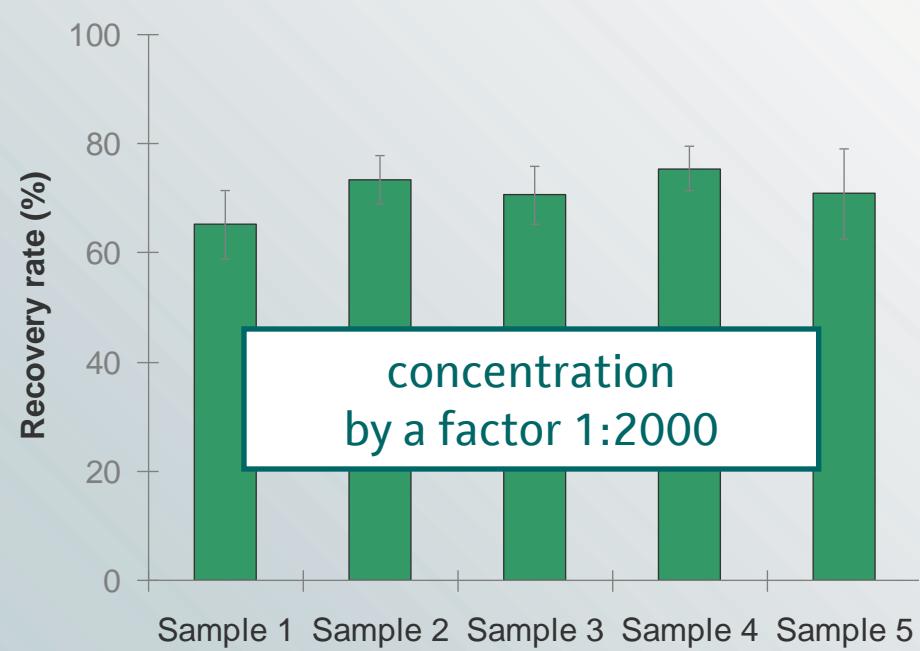

- bacteria grown on minimal medium
- preset bacterial concentration approx. 10000 cfu/10 liter
- Tests of recovery rate by following methods:
 - **β -Galactosidase_MUG_assay**
 - **Luciferase_ATP_assay**
 - **Colony counting on lactose_TTC_agar**

Tests of Recovery Rate

November 2011

May 2012

Current Situation

Minimal input volume - 10L

- concentrate 10mL
- concentration factor 1:2000 (10000 cfu/10ml)
- time approx. 40 min
- recovery rate with *E.coli* ca. 65%

BIOSENSOR - Measuring Bacterial ATP by Luminescence

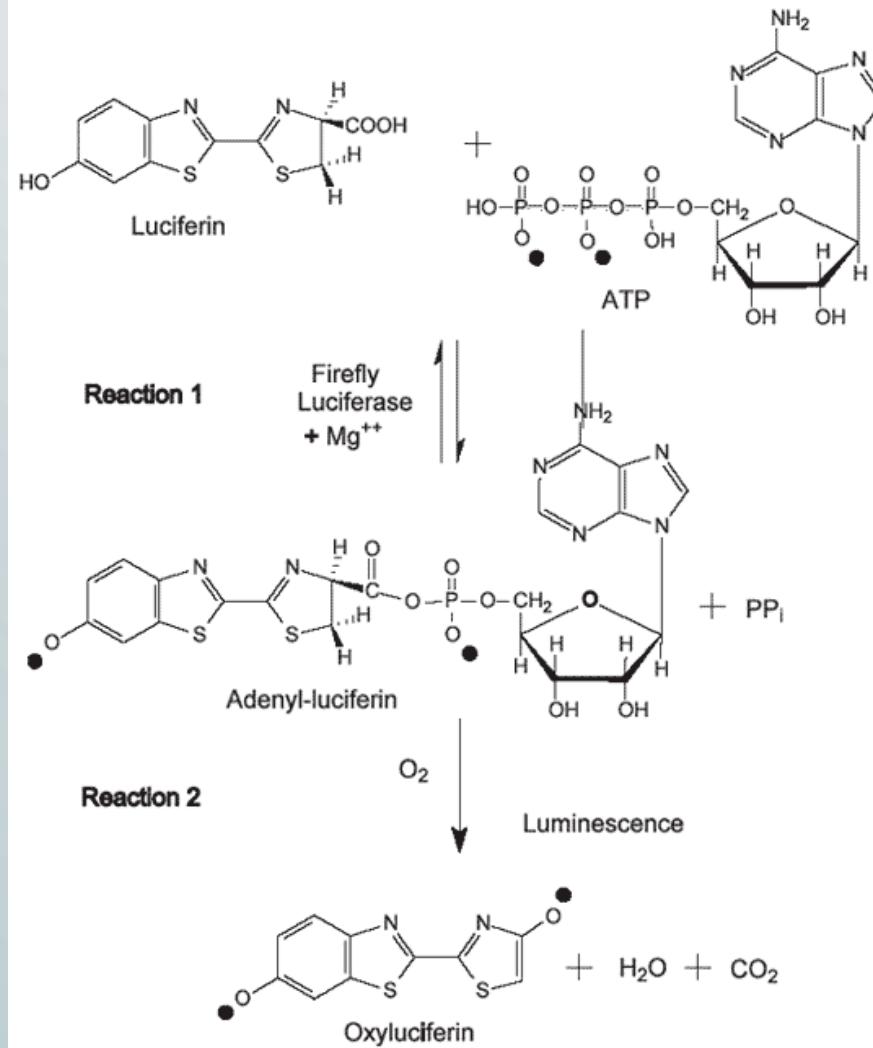

Luciferase

- Firefly (*Photinus pyralis*)
- luciferin-4-monooxygenase
- bifunctional enzyme
- 61kDa protein
- localised in peroxisomes

Reaction Mechanism

Luminescence Biosensor

Flow-through chamber

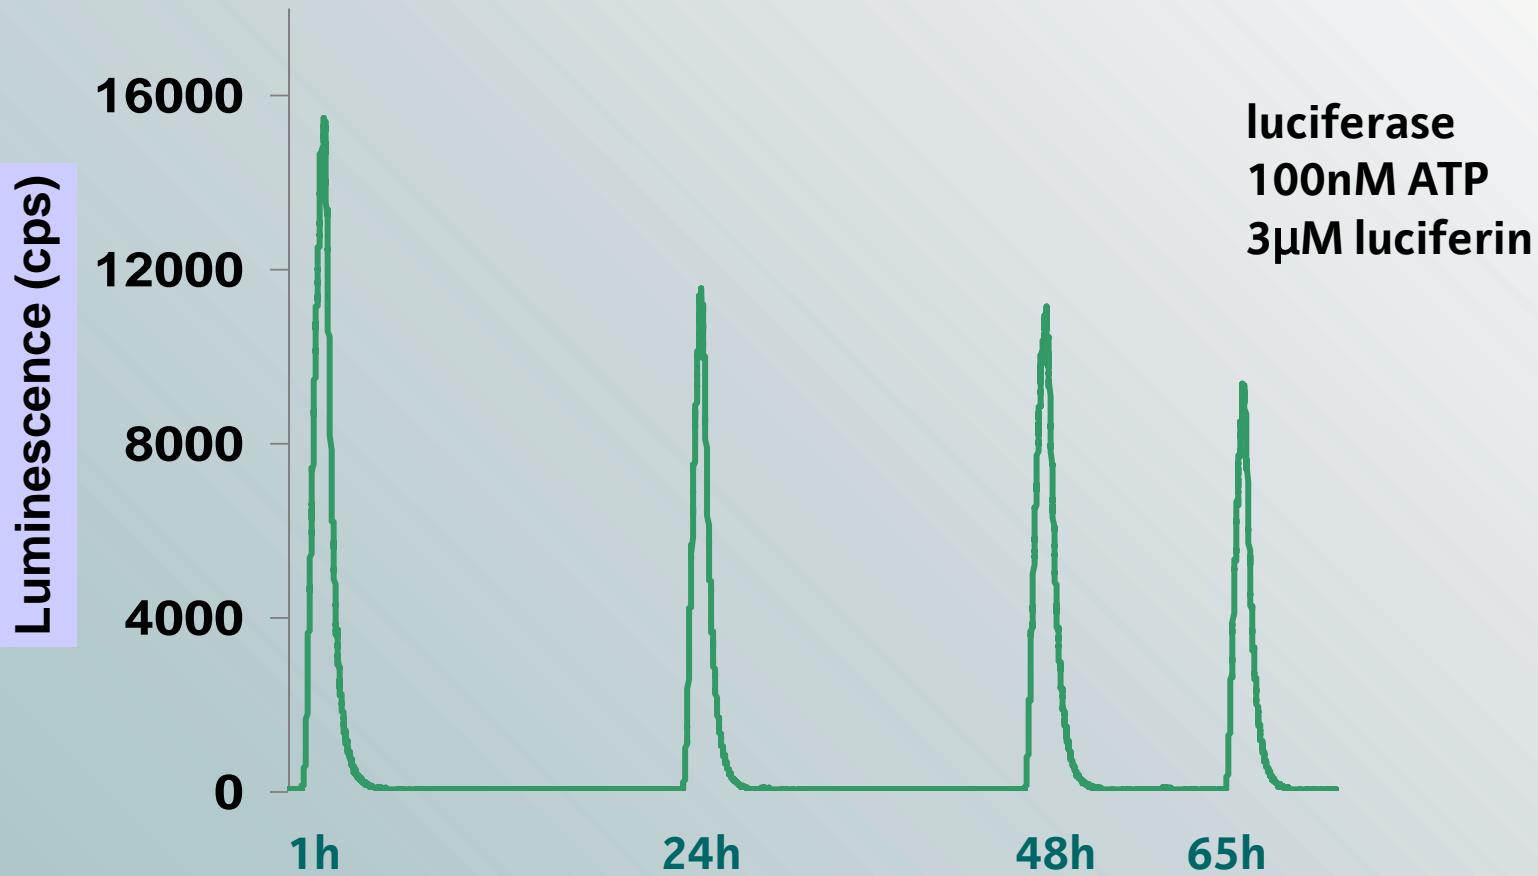

- luciferase coupled on beads
- application of bacterial ATP and luciferin

luminescence detector - photomultiplier

Long-Term Measurements

biological · biophysical · engineering

bbe
moldaenke

Integration of All Components

Robotic device with linear actuator

PCR device

Foil disk

Outlook

- increase the stability of luciferase
- test other bacterial species
- long-term measurements in whole-device configuration
- integration of sample preparation with PCR
