

MONITORING THE APPEARANCE OF THE CYANOBACTERIA PLANKTOTHRIX RUBESCENS IN RESERVOIRS IN MIDDLE EUROPE

NEW APPROACHES FOR AUTOMATICAL IDENTIFICATION

Andreas Mokros, Waterworks Glüder
Sönke Kobarg, bbe Moldaenke, Germany

North Rhine-Westphalia
(part of it)

North Rhine-Westphalia

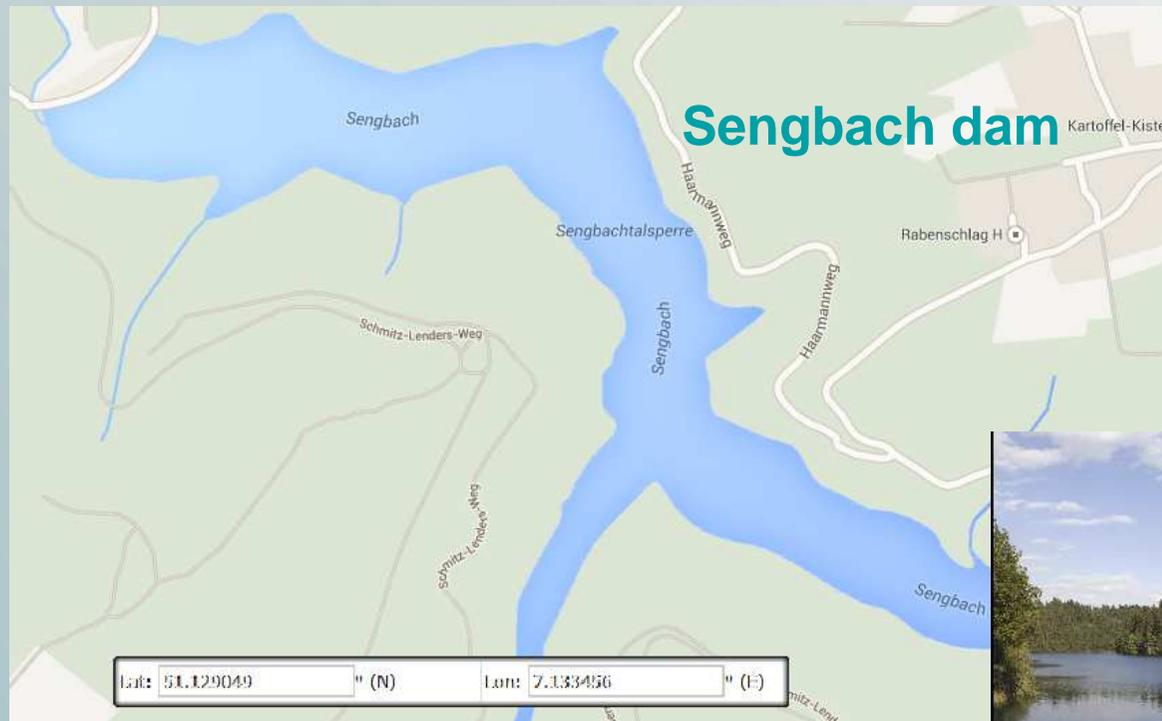

16,6 Mio. inhabitants (2013)

Water consumption 130 l/day

= 2,2 Mio. m³/day total

The area of interest in 2013

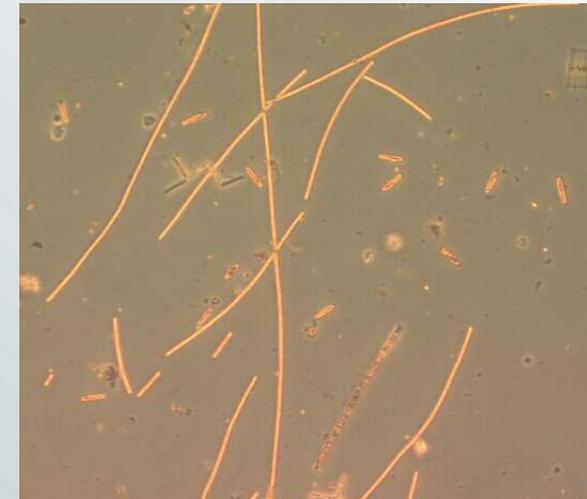

20 ha
2,8 Mio. m³
Maximum depth 36 m

Extraction for drinking water processing

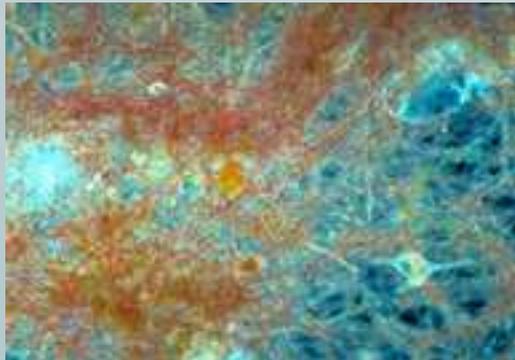

massive dam with waterworks Glüder

Planktothrix rubescens

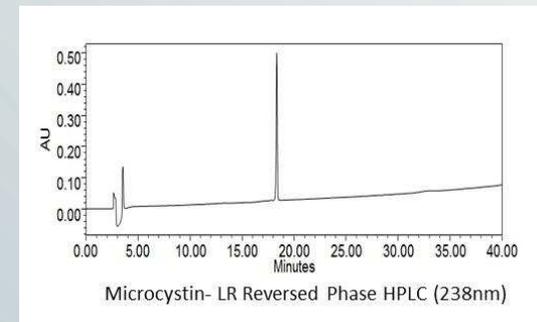

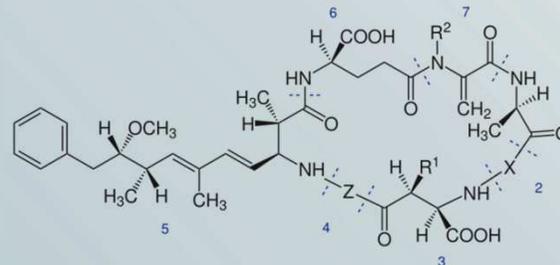

The threat of the Planktothrix

Planktothrix rubescens

→ Cyanotoxin →

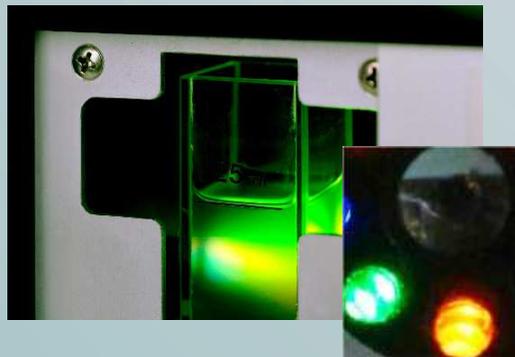

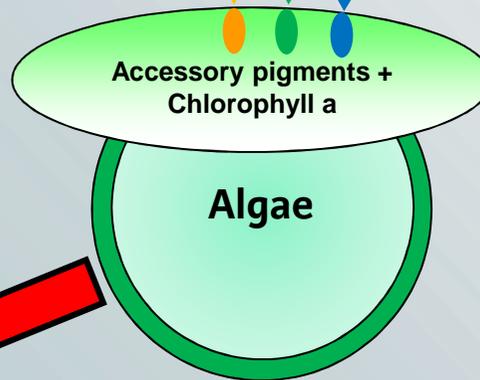

- Reduce water quality
- Raise health risks
- Additional counteractions
- Raise costs
- Close of extraction

How it works: fluorometric measurement of algal and cyanobacterial microplankton

Excitation of pigments with light of different wavelengths

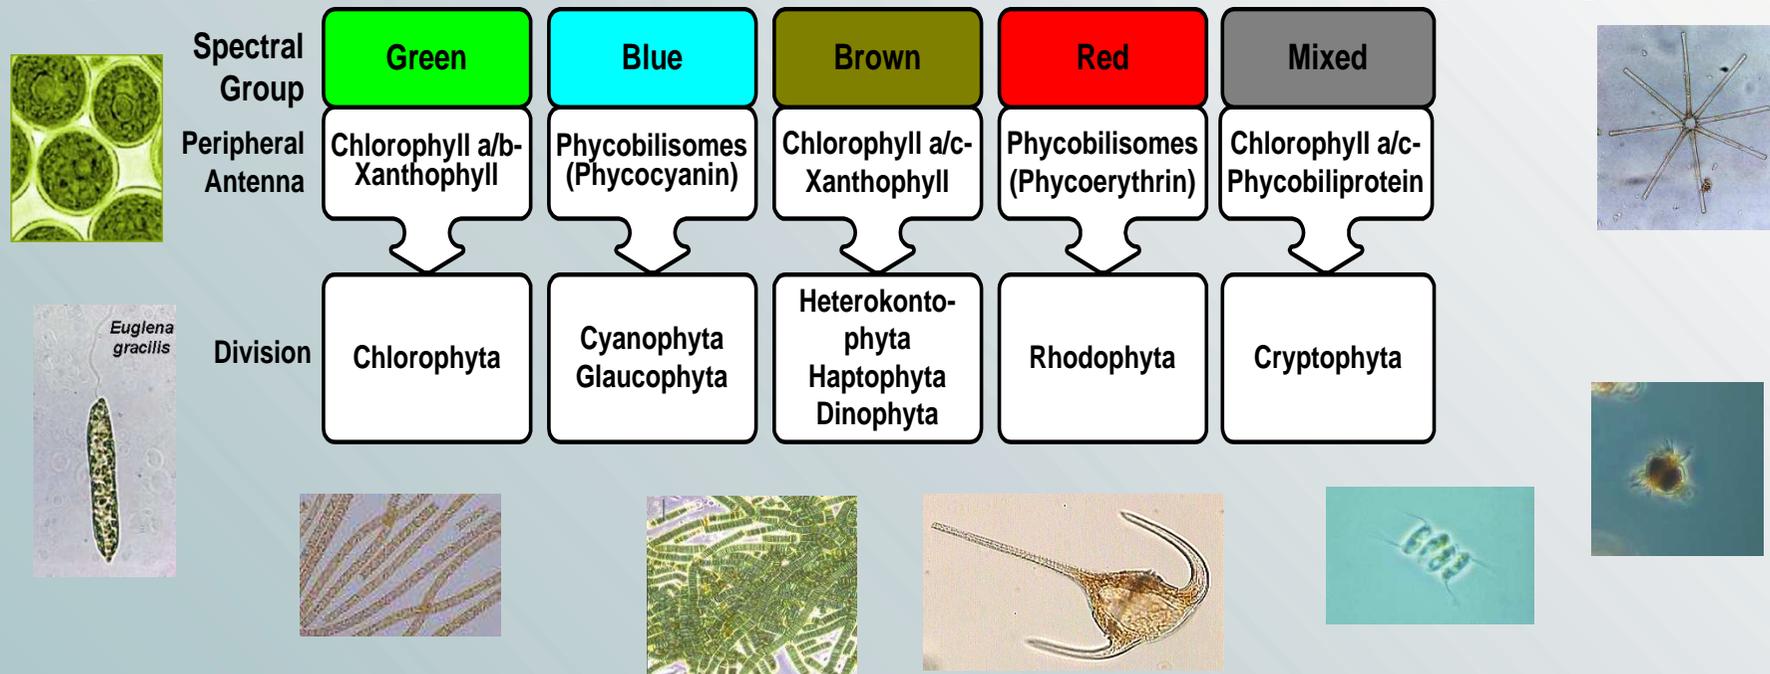

Determination of chlorophyll fluorescence

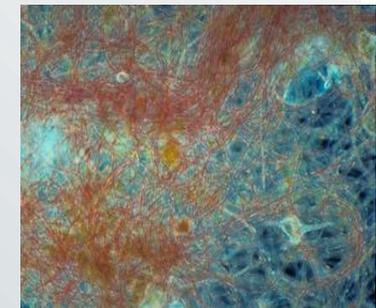

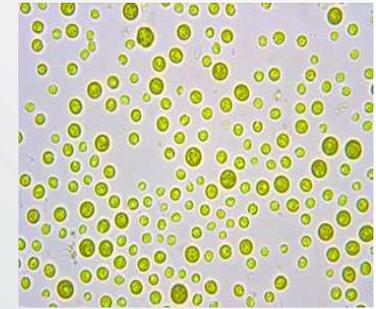

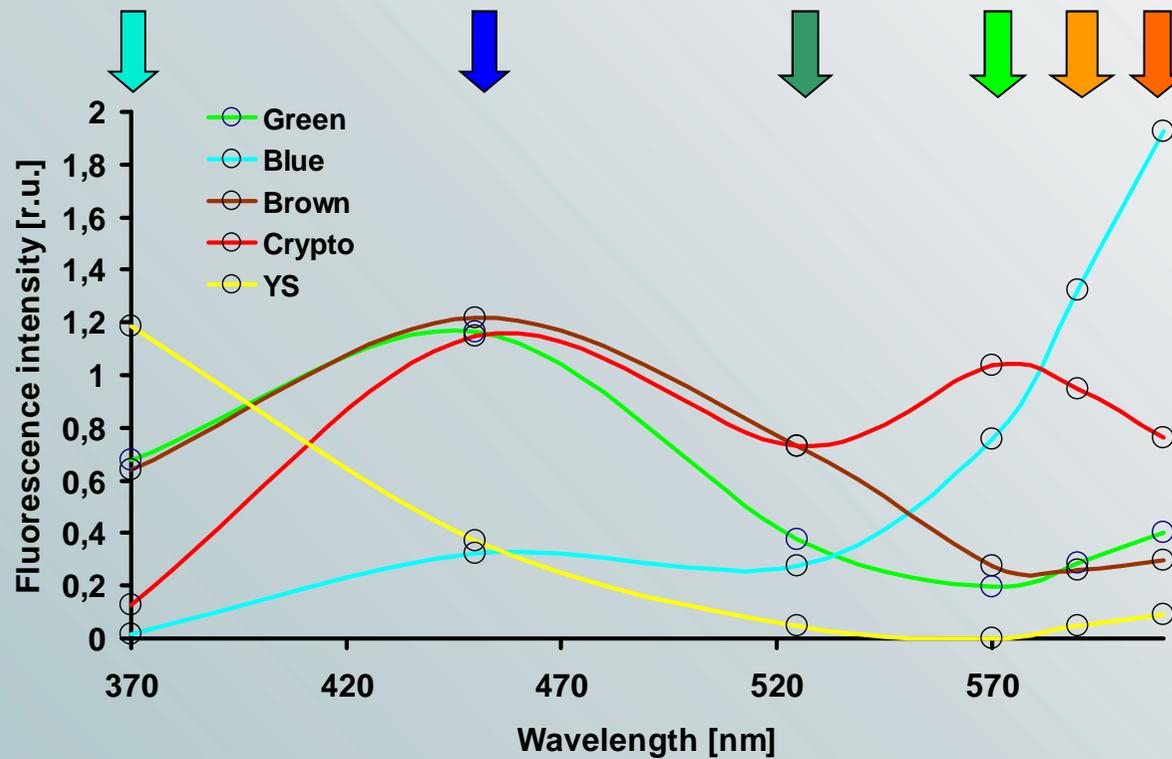

What are the Algae classes?

Algae classes contain different accessory pigments

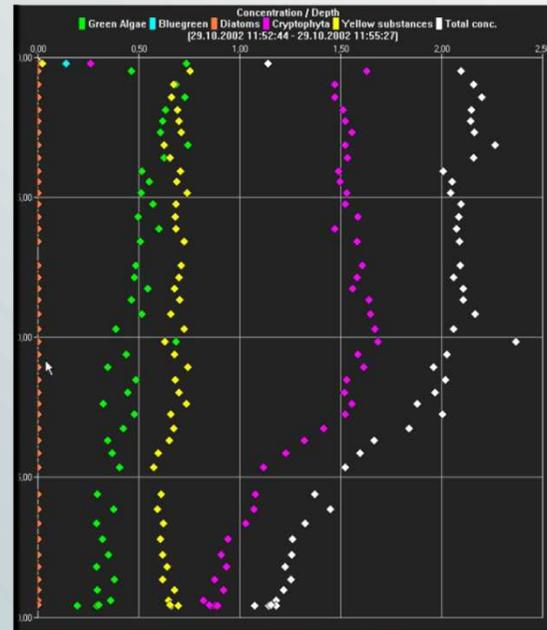

...which affect the chlorophyll fluorescence emission in characteristic pattern

Who is Who: Norm spectra

(fingerprints) of algae classes including *Planktothrix* from a cell library

What can multispectral fluorometry accomplish?

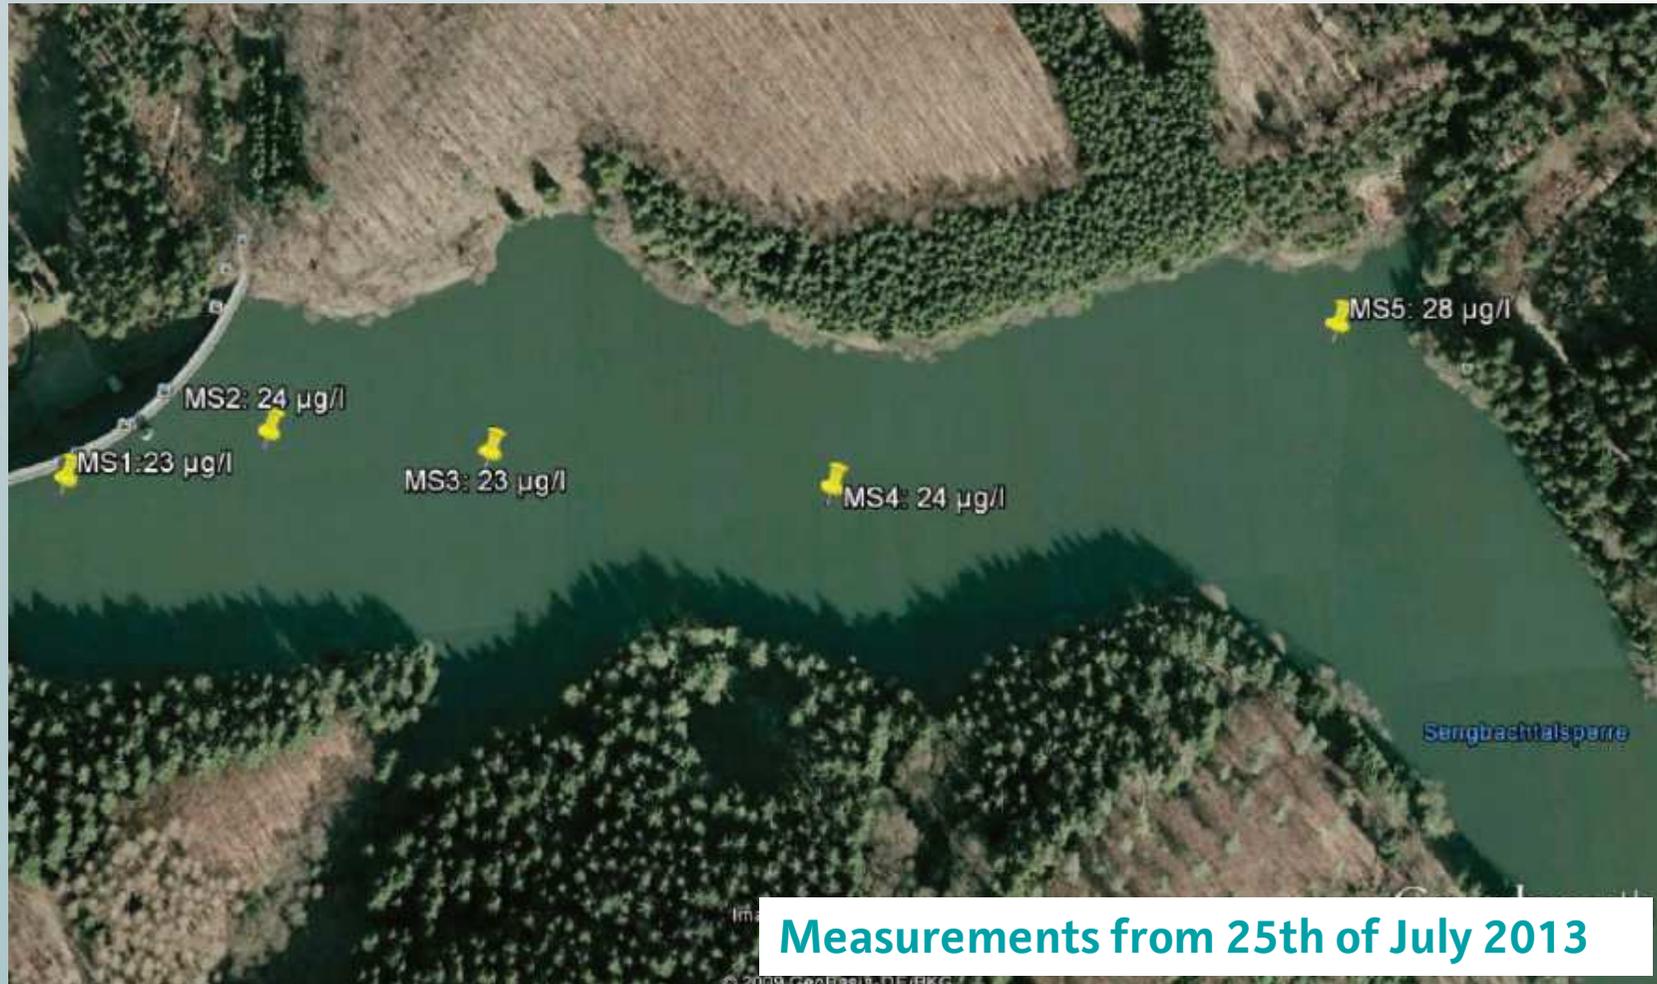

- Differentiation of algal classes in a complex mixture
- Determination of cyanobacteria i.e. *Planktothrix*
- Determination of chlorophyll content
- Correction for fluorescent interfering substances

Online measurement at the intake of the waterworks

profile measurements in the dam

Distribution of *Plankthothrix rubescens*

Depth profiles of *Plankthothrix rubescens*

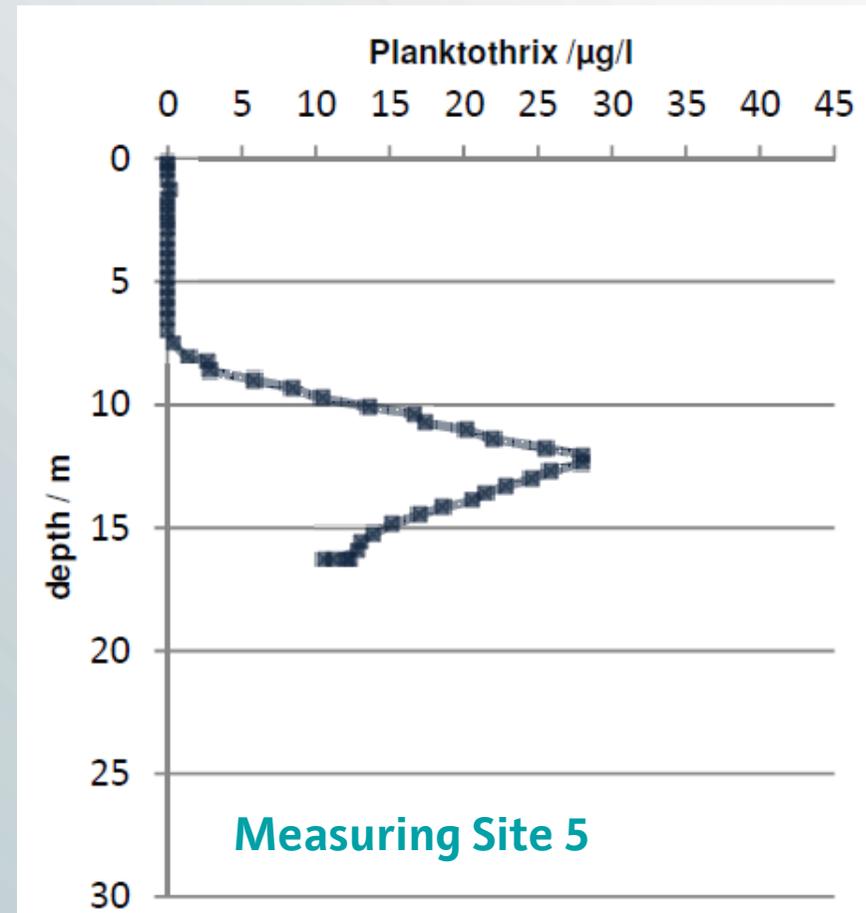

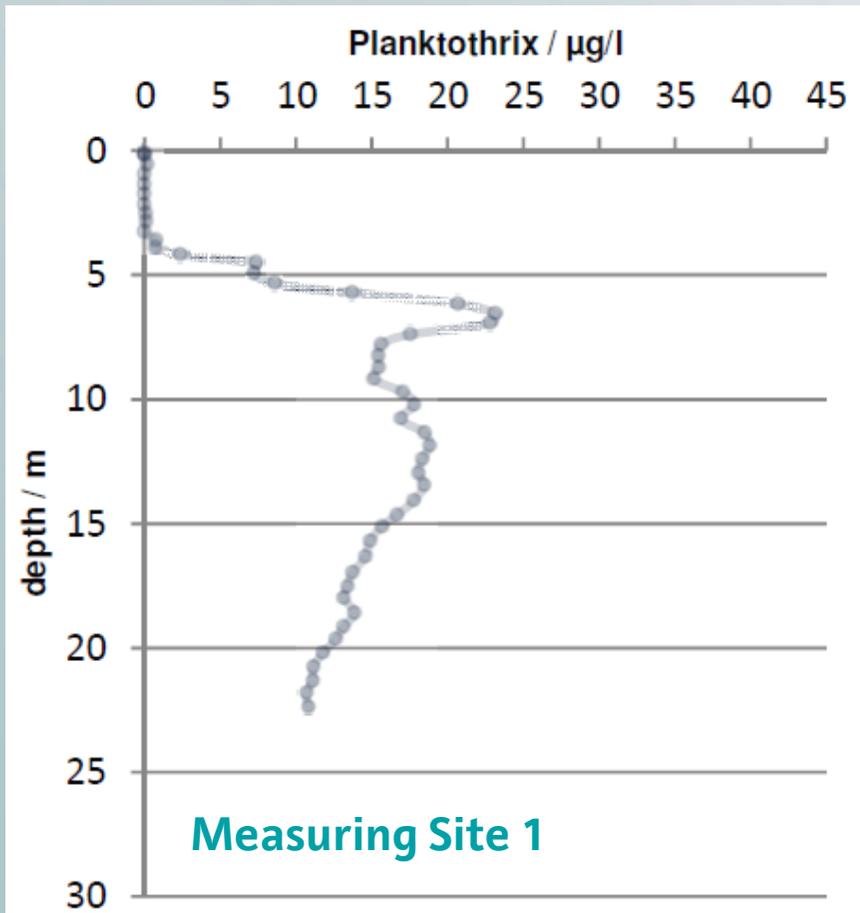

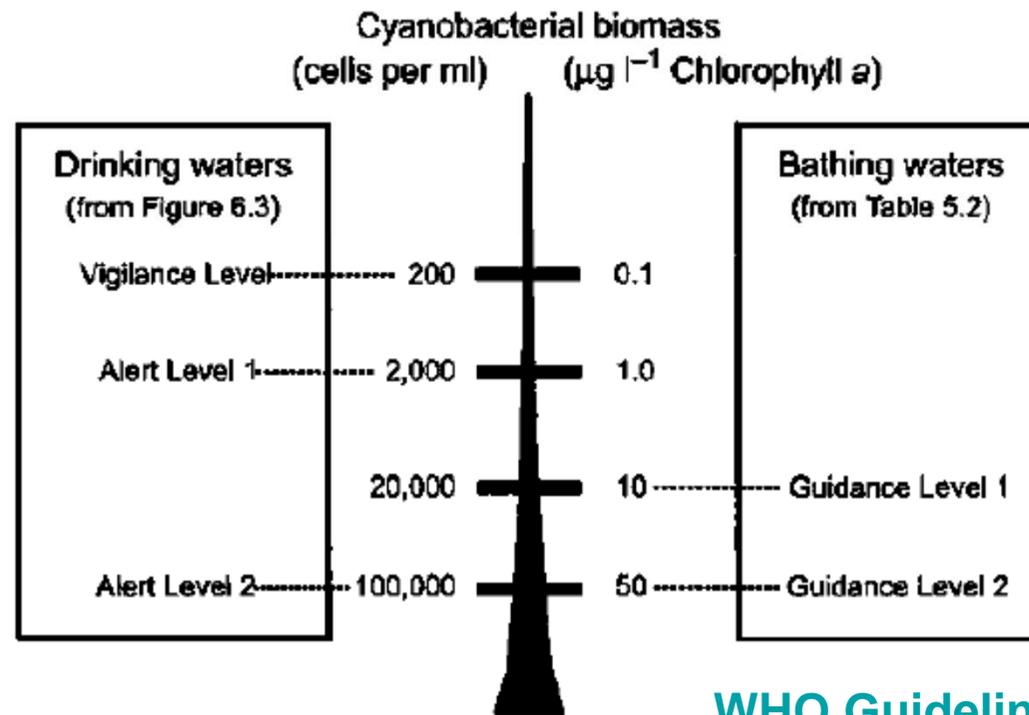

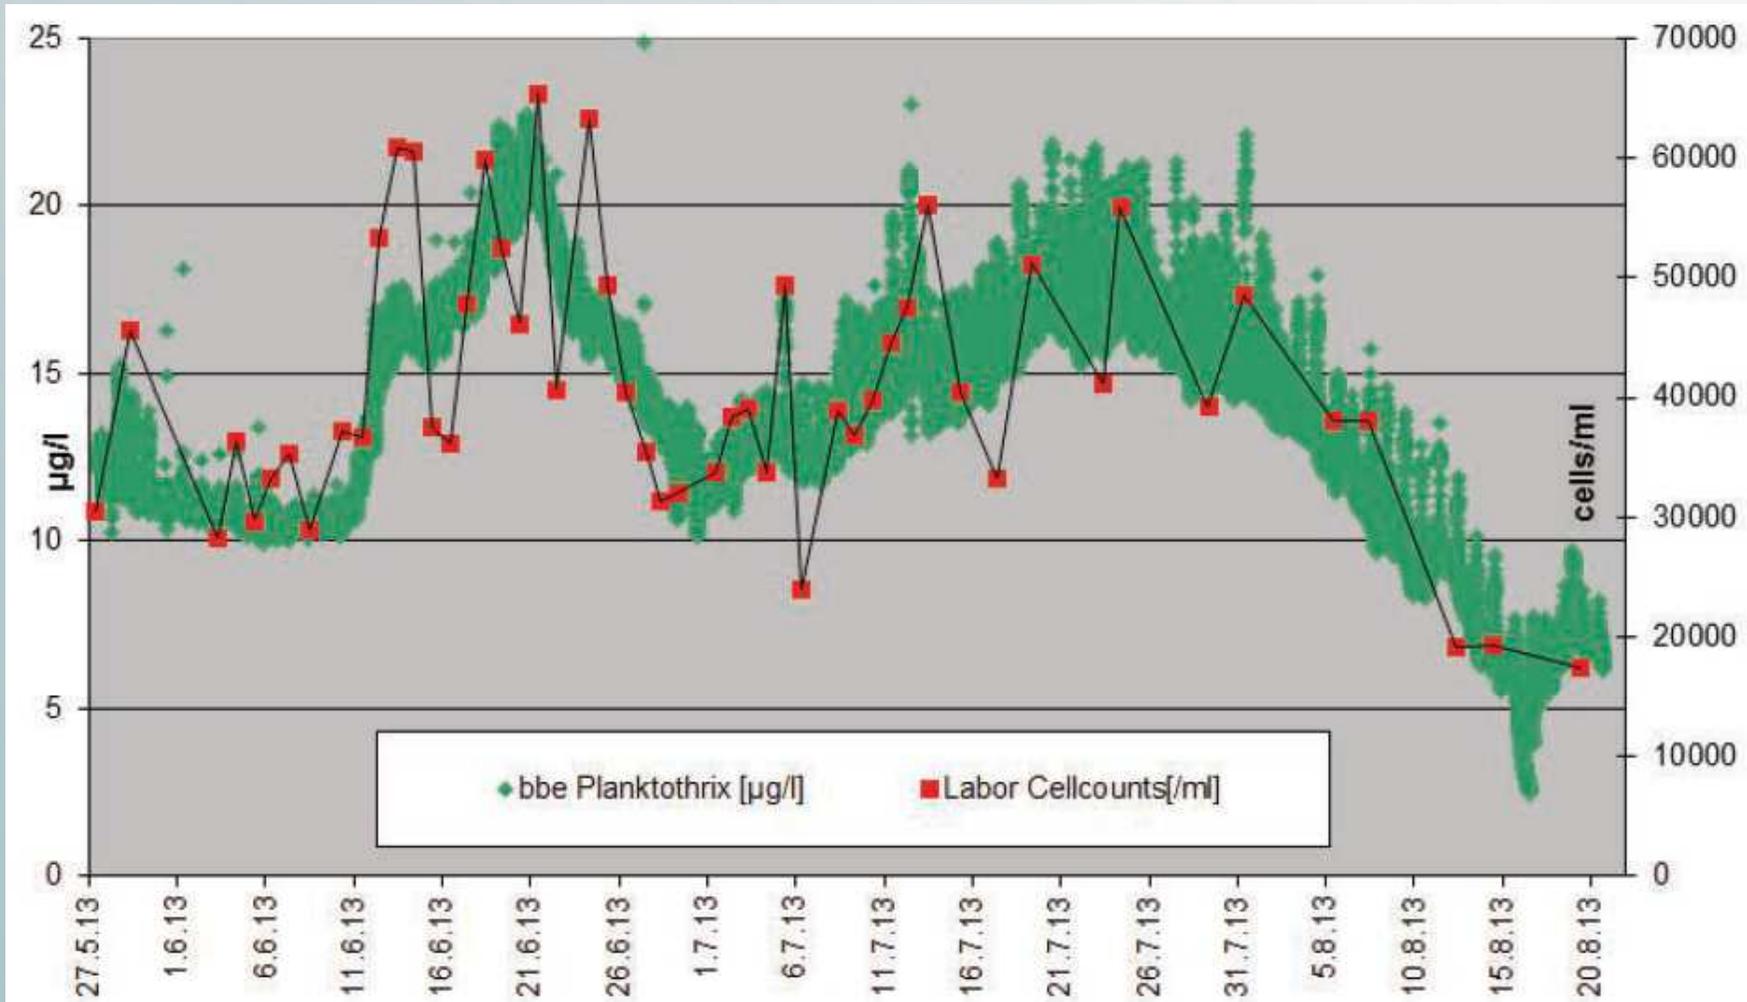

Figure 6.5 Summary of managerial action levels for drinking waters (see Alert Levels Framework decision tree in Figure 6.3) and for bathing waters (see Guidance Levels in Table 5.2). Note that for bathing waters, the special Guidance Level 3 (scum formation) can be achieved during calm weather conditions at open water biomass levels similar to Guidance Level 1

Compare the cell counts

Conclusion

Fluorometric depth profiling and flow through online analysis are a sensitive and rapid tool for the detection of upcoming Plankthotrix
